CONTRIBUTION OF SECTORS TO S&P 500 DISPERSION

COMMENTARY

- Sector performance was broadly positive in Q2, with Technology leading gains across the capitalization spectrum, including a 43% surge among large caps. By contrast, Energy lagged across all size segments, with large caps falling 13%.
- The contribution of cross-sector effects to total S&P 500® dispersion decreased in June, moving below its long-term average for the first time since January 2026.

COMMENTARY

- S&P 500 sector notional volumes grew in June, led by gains in Technology, Financials, and Energy. On a seasonally adjusted basis, however, sector futures volumes softened overall, driven by declines in Communication Services and Energy. Similarly, Energy ETP volumes decreased.
- Technology increased its share of sector volumes over the past 12 months, while both Consumer Staples and Consumer Discretionary lost share.

S&P 500 SECTOR ETP AND FUTURES NOTIONAL VOLUMES

June Notional Volume Composition

Year-over-Year Change in Share of Sector Volumes

NOTES

Notional Volume is the total dollar value of traded activity across futures and ETPs. For futures, notional volumes are calculated by multiplying the total number of contracts traded by the average monthly index price level of the contract. For ETPs, they are instead based on the number of shares traded and the execution price of those shares. Leveraged ETPs adjust the ETP notional volumes calculation further to account for the product's leverage, so higher-leverage instruments contribute proportionally more to total notional values.

Seasonally-Adjusted Absolute Difference provides the monthly change in the dollar value of S&P 500 sector ETP and/or futures trading after adjusting each month for recurring calendar effects such as futures expirations and roll cycles. The seasonal adjustment inflates or deflates trading activity by a proportion equal to the average increase or decrease observed at the same point in prior quarters, measured over a 20-quarter rolling historical window.

Notional Volume Composition shows the current share of total trading activity represented by each sector. It is calculated by dividing the total ETP and futures notional volumes for each sector by the combined notional volumes across all sectors.

Year-over-Year Change in Sector Share of Volumes shows how a sector's portion of total trading has shifted compared to its recent trend. It is calculated by subtracting the sector's trailing 12-month average notional volume share from its current month's share.

INDEX COMPOSITION

KEY TO FACTOR SCORINGS FOR INDICES

Factor Definitions

Each constituent of the S&P 1500 index is provided with a factor "score" for each of Beta, Volatility, Momentum, Dividend, Size, Value and Quality.

Factor Measurement at single-stock level

Volatility Trailing 12-month daily return volatility

Momentum Twelve-month price change as of one month ago ("13 minus 1 momentum"), divided by the daily volatility during the twelve-month period that ended one month ago. For more details, see the [S&P Momentum](#) methodology

Value The average of (normalized) earnings to price ratio, book to price ratio and sales to price ratio. For more details, see the [S&P Value](#) methodology.

Beta Trailing 1 year beta of stock daily returns to the benchmark's return.

Dividend Trailing 12-month dividend

Quality The average of the (normalized) return on equity, the negative of the accruals ratio and the negative of the financial leverage ratio. For more details, see the [S&P Quality](#) methodology.

Size Free-float market capitalization

Index Factor Ranking and Factor Diagram Scaling

Index Scores

Each index is provided a score in each factor from -100% to +100% based on how much of the total capitalization of the benchmark must be excluded in order to provide a portfolio of stocks with similar exposure to that factor. This is done by examining a ranked series of hypothetical cap-weighted portfolios, including or excluding an increasing number of the stocks with the highest or lowest scores. An illustration of the process may be found at this [link](#).

Factor Diagram Axis

COMMENTARY

- The diagrams below illustrate factor exposures relative to the S&P 1500 across sectors, from large to small-caps.
- For example, large-cap Consumer Discretionary has a tilt away from Low Volatility, which deepens at the small-cap level.

Current and Average Adjusted HHI for S&P 500 GICS Sectors***

COMMENTARY

- Industrials had the highest relative strength among large-cap sectors.

For details on definitions of fundamental metrics, please refer to the disclosure section. Value and Growth scores are rescored for the S&P Total Market Index universe annually every December.

*Financials & Real Estate SmallCap Capped Sector combines constituents of the GICS Financials and Real Estate sectors.

**Utilities MidCap and SmallCap Capped Sectors include constituents of the GICS Utilities and Communication Services sectors.

Source: S&P Dow Jones Indices LLC, FactSet. Data as of June 30, 2026. Index performance based on total return in USD. Past performance is no guarantee of future results. Chart/table is provided for illustrative purposes.

COMMENTARY

- Dispersion increased across sectors, particularly for large- and small-cap Information Technology.
- Correlations increased within sectors, particularly for large-cap Utilities and mid-cap Communication Services.

SECTOR DISPERSION AND CORRELATION

NOTES

- The charts above decomposed volatility into its two main components: dispersion and correlation. The data points are each sector's average monthly value over the trailing 12 months. Trailing annualized volatility is included in parentheses. Index dispersions shown based on stock-level index-weighted dispersion over the calendar month. Index correlation based on single stock daily total returns during each calendar month. See ["Implications of Sector Dispersion"](#) for more information.
- See ["At the Intersection of Diversification, Volatility and Correlation"](#) for details on the relationship between correlation and dispersion.
- See ["Dispersion: Measuring Market Opportunity"](#) for the definition of index dispersion and more information on the uses of dispersion.

FUNDAMENTAL STATISTICS	NOTES
Price/Earnings (P/E)	Price per share as of observation date divided by earnings per share, calculated by adding the last twelve calendar months' quarterly reported earnings per share.
Price/Book (P/B)	Price per share as of observation date divided by latest annual reported book value per share.
Price/Sales (P/S)	Price per share as of observation date divided by sales per share, calculated by adding twelve calendar months' quarterly reported sales per share.
RSI - 30 Day	RSI is an indicator of the speed and change of price movements and oscillates between zero and 100. RSI is considered overbought when above 70 and oversold when below 30. RS is the average gain divided by average loss over the past 30 days. Then RSI is equal to 100 minus 100 divided by 1+RS.
